

HIV Human Immunodeficiency Virus

Causes acquired immunodeficiency syndrome (AIDS)

Infection with HIV occurs by the transfer of:

Blood

Semen

Vaginal fluids

Breast milk

Signs and symptoms:

- Fever
- Lymphadenopathy
- Pharyngitis
- Rash
- Myalgia
- Malaise

Diagnosis:

1. Initial screening with an enzyme-linked immunosorbent assay
2. Repeatedly reactive and undergoes confirmatory testing
3. More specific supplemental test

Treatment:

Current treatment for HIV infection consists of highly active antiretroviral therapy.

In the United States the campaigning against AIDS, although these have scored more with youth:

- Campaigning in sticker albums
- It also has a journal called "POZ",
